Problem Statement: AI-Driven NSAP Scheme Predictor

The Challenge

The National Social Assistance Programme (NSAP) provides financial assistance to eligible beneficiaries through multiple welfare schemes. However, identifying the most suitable scheme for an applicant is often a manual, time-consuming, and error-prone process. Beneficiary information must be verified against various eligibility criteria, increasing processing time and the possibility of incorrect scheme allocation. A lack of automated decision support can also lead to inconsistencies and delays in delivering government benefits.

The Objective

Develop an AI-powered NSAP Scheme Predictor that automatically recommends the most appropriate welfare scheme based on applicant demographic and socio-economic information. The solution should:

- Automate Scheme Prediction – Predict the most suitable NSAP welfare scheme using beneficiary data.

- Machine Learning-Based Classification – Use IBM watsonx.ai AutoAI to build and deploy an optimized classification model.
- Real-Time Prediction – Provide instant scheme recommendations through an interactive web application.
- Accurate Decision Support – Reduce manual effort and improve consistency in beneficiary selection.
- User-Friendly Interface – Allow users to enter applicant details through a simple and intuitive dashboard.
- Scalable Deployment – Enable future integration with government databases and additional welfare schemes for nationwide implementation.
